

Making Maps With R

Background: Spatial data are becoming increasingly common, as are the tools available in R to process it. Of course one of the best ways of visualizing spatial data is through a map. Maps need to be well thought out. Not least, the selected colours need to be appropriate and sufficient context is provided through the use of a legend, title, scale bar and north arrow. The worksheet will demonstrate how to produce a map with R that includes all these elements.

Data Requirements:

London Sport Participation Shapefile. Download (requires unzipping)

Install the following packages (if you haven't already done so):

maptools, RcolourBrewer, classInt

Code (Comments are preceded by ##)

```
## Load required packages
```

```
library(maptools)
```

```
library(RColorBrewer)
```

```
library(classInt)
```

```
## set the working directory.
```

```
setwd("/xxx/xxx/")
```

```
## load the shapefile
```

```
sport<- readShapePoly("london_sport.shp")
```

```
##have a look at the attribute table headings
```

```
names(sport)
```

```
## Plot map showing the percentage of the population in each borough participating in regular sports activities.
```

```
## select a colour palette and the number of colours you wish to display.
```

```
colours <- brewer.pal(5, "Blues")
```

```
## we first need to set breaks in the data in order that we have a representative colour palette. This can be done manually by simply looking at the data and guessing:
```

```
#brks<-c(10, 15, 20, 25)
```

```
## or (preferably) we can use the classIntervals function in the classInt package:
```

```
brks<-classIntervals(sport$Partic_Per, n=5, style="quantile")
```

```
##using the plot function you can plot the distribution of the data and view the colours
```

assigned to each point.

```
plot(brks, pal=colours)
```

```
## from this point on we are only interested in the break values, we can therefore extract them from the brks object above:
```

```
brks<- brks$brks
```

```
##Now we can produce the map:
```

```
plot(sport, col=colours[findInterval(sport$Partic_Per, brks, all.inside=TRUE)], axes=F)
```

```
## we can add:
```

```
##a border  
box()
```

```
## a title:
```

```
title(paste ("London Sports Participation"))
```

```
## a north arrow:
```

```
SpatialPolygonsRescale(layout.north.arrow(1), offset= c(505100,160000), scale = 6000, plot.grid=F)
```

```
## a legend
```

```
legend(x=548500, y=164800, legend=leglabs(brks), fill=colours, bty="n")
```

```
## a scale bar:
```

```
SpatialPolygonsRescale(layout.scale.bar(), offset= c(503800,154800), scale= 10000, fill=c("transparent", "black"), plot.grid= F)
```

```
## and some annotations:
```

```
text(509000, 153500, "10KM", cex= 1)
```

```
text(534000,152000, "Boundary Data Crown Copyright Ordnance Survey 2009.", cex= 1)
```

```
text(556500, 166000, "% Participation", cex= 1)
```

##Disclaimer: The methods provided here may not be the best solutions, just the ones I happen to know about! No support is provided with these worksheets. I have tried to make them as self-explanatory as possible and will not be able to respond to specific requests for help. I do however welcome feedback on the tutorials. License: cc-by-nc-sa.
